## Clovis Landfill Reclamation Project

In order to increase the life expectancy of the Clovis, CA municipal landfill while mitigating groundwater issues, providing a source of soil, and placing old waste in a lined portion of the landfill, Kroeker, Inc. excavated and sorted the facility's buried waste, sorting the excavated material, screening it, saving the soil for reuse, and returning the screened waste to the landfill's active face. They processed over 2.5 million cubic yards thereby allowing the city to reutilize and expand its landfill for a much longer period of time. It also mitigated groundwater contamination, and the soil recovery eliminated the need to import millions of tons of new soil for ongoing operations. The project added 30 years to the facility's lifespan.
