TOTAL RECORDABLE INCIDENT RATE (TRIR) - a mathematical calculation that describes the number of employees per 100 full-time employees that have been involved in a recordable injury or illness.

$$\text{IR} = \frac{\text{Number of OSHA Recordable Cases X 200,000}}{\text{Number of Employee labor hours worked}}$$

DART Rate - a mathematical calculation that describes the number of recordable incidents per 100 full time employees that resulted in lost or restricted days or job transfer due to work related injuries or illnesses.

$$\text{DART} = \frac{\text{Total Number of DART incidents x 200,000}}{\text{Number of Employee Labor Hours Worked}}$$

LTIR - a mathematical calculation that describes the number of incidents that result in time away from work. Not all recordable incidents result in lost time, which is why there is a separate calculation for these more severe incidents.

$$\text{LTIR} = \frac{\text{Number of lost time cases x 200,000}}{\text{total number of hours worked by employees}}$$
